# New Indicator Probe for 75mil, .400 Stroke

July 13, 2015

QA Technology is pleased add a .075 [1.91] center, .400 [10.16] long stroke indicator probe; part number: **IP075-4043**, to our family of indicator probes.

The Indicator Probe is a special use probe, which shows the amount that standard probes are deflected in a test fixture. The indicator probe's plunger does not return to its original extended position after deflection. Indents in the side of the probe tube interfere with the free motion of the plunger and hold it at the position of maximum deflection. After numerous uses the indicator probe may lose its ability to remain in the deflected position and should be replaced.

Indicator Probes are identical in external dimensions to their standard counterparts. The entire plunger is unplated, so that it can be easily distinguished from a standard probe. Indicator probes are not intended for use as electrical contacts.
